CORONA is a well-balanced bull out of one of our favorite brood cows with a lifetime average calving interval of 362.8 days. As a virgin bull exposed to 21 heifers for 24 days, Corona settled 18, or 85% to calve in the first 3 weeks of the calving season. We expect Corona to transmit this fertility to his offspring. The cow family that Corona comes from are easy-keeping, high butterfat cows with well-above average milk volume and hand-milking teats. CORONA will add substance and capacity while still retaining the dairy qualities needed for high-producing cows. With BB proteins for cheese and butter production, A2A2 Beta Casein and Homozygous Polled, there is not much CORONA can't do to make progress in a mating.
